MODULE 1 · EXPERIMENT WITH AI AGENTS · LESSON 2

Exercise 2: Verify an Agent's Output

WHY THIS EXERCISE

When you delegate work to an AI agent, you're still responsible for the result. This exercise gives you practice with two ways to check agent output—reviewing it yourself and using a second agent to review it—so you can catch errors before they reach anyone else.

INSTRUCTIONS

In an earlier exercise (*Experiment with AI Agents – 1 – Exercise 1),* you gave a general-purpose agent a prompt and it gave you a response. In this exercise, you'll go back to that prompt and response and check whether the agent's work was actually accurate and complete.

You'll do this in two ways: first by checking the response yourself (a manual review), and then by copying the prompt and response into a different agent and asking it to find problems (the agent-as-judge pattern). After both checks, you'll use metaprompting to improve your original prompt based on what you found.

SETUP

1. Find the prompt you used and the response the agent gave you from *Experiment with AI Agents – 1 – Exercise 1*. If you no longer have the response, run the prompt again.
2. Make sure you have access to at least two different general-purpose agents: Claude, ChatGPT, Gemini, or Copilot. You'll need a second agent for the agent-as-judge step.
3. Pick one prompt and response to verify. Choose something where the agent gave a substantive answer—enough detail that checking it is meaningful.

TASKS

1. Check the agent's response yourself. Read through it and look for anything that seems wrong, incomplete, or made up. Check key claims against a source you trust, your own knowledge, or basic logical consistency. Note what you checked and what you found.
2. Perform an agent-as-judge check. Copy your original prompt and the agent's response into a different general-purpose agent and ask it to critique the work. (See the example prompt below if you need a starting point.)
3. Refine your prompt using metaprompting. Based on the problems you found in steps 1 and 2, use an agent to help you rewrite the original prompt—tightening scope, adding constraints, and eliminating ambiguity. (See the second example below if you're not sure how to start.)
4. Answer the questions below.

Here's an example of what an agent-as-judge prompt looks like:

> *I gave an AI agent the following prompt and received the response below. Please evaluate the response for factual accuracy, missing information, and assumptions not stated in the original prompt. List any issues you find.*
>
> *[Original Prompt]*
>
> *[Agent's Response]*

And here's an example of how to use metaprompting to improve your original prompt based on what you found:

> *The prompt below produced a response with the following problems: [list the problems you found]. Rewrite the prompt to fix these issues. Focus on tightening the scope, adding constraints, and eliminating ambiguity. [Original Prompt]*

QUESTION 1

What process did you use to check the agent's response yourself, and what did you find?

Be specific—what did you check, and how did you decide whether the response was trustworthy?

I checked the agents response by comparing it to the websites which the agents used (gasprices.aaa.com/?state=MO) compared each data(missouri metro Average prices, St. louis price's compared with current price with yesterday price). All the data looked accurrate.

QUESTION 2

What discrepancies, if any, did you find during your own review that the agent-as-judge missed or you overlooked?

If both checks surfaced the same issues, that's worth noting too—what does that tell you about the response?

Both my own review check and the agent as judge had the same results the price were correct. the response was reliable.

QUESTION 3

What is your revised prompt, and what specific problems from the verification steps did the revision address?

Share the updated prompt and briefly explain what you changed and why.

sentences.
4. Mentioned to display data of Missouri statewide for all grades exactly one week ago.
5. Also to prevent acting on outdated information older than 48hrs.

QUESTION 4

Based on these checks, how confident are you in the agent's original response? Why is manual verification still required even after an agent-as-judge confirms the results?

I am confident with the agent's response as it was well organized and clearly sourced. Still i feel manual verifications are really needed because sometimes it can have the old or not updated data values.
