MODULE 1 · EXPERIMENT WITH AI AGENTS · LESSON 1

Exercise 1: Using an AI Assistant's Agentic Capabilities

WHY THIS EXERCISE

Throughout this course, you'll need to decide which AI tool is the best fit for a given task. This exercise starts building that judgment early: you'll observe how four AI agents handle the same request, notice the differences, and begin forming your own criteria for which tool fits which job.

INSTRUCTIONS

In this exercise, you'll compare how four AI agents handle the same question. The goal is not to craft the perfect question—it's to notice the differences in how each agent responds. Here are a few example questions to get you started:

- "What are the top skills employers are hiring for in [your field] right now?"
- "What major news has come out about [a company in your industry] this week?"
- "What are the latest updates or changes to [a tool you use for work, like Salesforce, Slack, or Google Workspace]?"

You can use one of these, adapt one to your own field, or come up with your own. Any question that requires the agent to look up current information will work.

SETUP

Before starting, open all four general-purpose agents:

- **Claude** — claude.ai
- **ChatGPT** — chatgpt.com

- **Gemini** — gemini.google.com
- **Copilot** — copilot.microsoft.com

TASKS

1. Choose a question that requires current, real-world information. (See the examples above if you need a starting point.)
2. Ask the **same question** in all four agents. If you need to adjust the question for a specific agent, note what you changed and why.
3. Answer the questions below.

QUESTION 1

What question did you use?

What is the current gas price in the USA, specifically in Missouri and compare it to last week's price and the latest price update?

QUESTION 2

How did each agent signal that it was doing agentic work rather than just generating text?

Describe the signals you observed across all four agents. Look for things like thinking indicators, search activity, loading states, tool labels, or any other visible cues the lesson described. For example, you might notice one agent displays "Searching the web..." while another shows a spinning icon and a list of sources it found.

ChatGPT - Displayed a " Searching the Web.."indicator observed the same in Copilot too. In Gemini didn't notice any indicators. In Claude Showed it was fetching data from sources.

QUESTION 3

Which agent's response was most useful to you, and why?

Think about things like: Did it actually answer your question with current information? Could you tell what steps it took to get there? Was the response organized in a way that was easy to use?

Claude was the most useful because it provided the most organized and detailed information.It compared prices between Missouri and USA in a timefame (till over a year). It compared by fuel grade(regular,Mid-grade,Premium) and compared the prices separately for Missouri metro area

QUESTION 4

Based on the signals you observed, how would you decide which agent to use for a task that requires current information?

Claude clearly showed it was fetching the data from sources and organized the result in a clean and easy to compare by broken down by category, location or timeframe.
